

Supplemental Figure 1. The topoisomer distribution of pUC19 after relaxation reactions is not altered in the presence of control polyamides lacking the conjugated acridine intercalator.

Supplemental Figure 2. The choice of 200nM GCN4 for EMSA was based on ~80% protein-DNA complex formation.

Supplemental Figure 3. GCN4 binding is not altered by the binding of control polyamides **5a**, **5b**, and **5c** lacking the conjugated acridine intercalator.
